

Study 64007957MMY3005 COVER LETTER

Compound name/Identifier	JNJ-64007957(teclistamab)
Protocol ID	64007957MMY3005; Phase 3
Item name	Recruitment Brochure
Item description	8.5" x 17"- A brochure provided to potential participants that includes high-level study information for recruitment purposes
Category	☒ Patient Recruitment ☐ Patient Retention ☐ HCP Recruitment ☐ Site Support ☐ Investigator Meeting ☐ Training
Intended audience/recipient (HCP/Patient)	Patient
Purpose	To provide potential patients with detailed information about the study using clear, easy-to-understand language
Print/Digital	Print
Other tactics associated with the same protocol	Recruitment Brochure, Caregiver Brochure, Participant Resource Guide - ARM A, Participant Resource Guide - ARM B, ICF Flipchart, DEICT Community PPT Slide Presentation, Physician Referral Letter, Site Set Up Guide, Branded Kit Box, Branded PPT Template, Site Newsletter Template, Mini Protocol, CRS & Neurotoxicity Cards, Study Reference Cards, Study Assistance Items - Tumbler and Blanket
If multi component, list everything that is included (example digital campaign)	N/A
Is there a sequence needed for review?	N/A
If applicable, delivery method of piece (ex, referral letters- how they are being sent)	Given in person by site staff to potential study participants
Any additional relevant information	Disclaimer: You are reminded of your and your employer's obligation to adhere to all local privacy policies and state and federal regulations with respect to the protection and use of patients' health information. This

	content should be distributed only to individuals who you know want to receive communications and information of this type.
--	---

What can I expect if I join this study?

If you potentially qualify and choose to join the study and sign the informed consent form, you will be asked to attend a screening visit with the study doctor. At this visit, you will undergo tests and procedures to determine if you are a good match for continuing in the study.

- If eligible, you will be in the study for as long as you are responding to your study medication and do not experience side effects that prevent you from continuing to take it. You will visit the study doctor or clinical research staff regularly throughout your study participation.
 - Study visits will become less frequent as you continue in the study
- You may be randomly assigned (like drawing numbers out of a hat) to 1 of 3 groups:
 - **Group A:** Receives one of the investigational medications + standard multiple myeloma medications
 - **Group B:** Receives the other investigational medication + standard multiple myeloma medications
 - **Group C:** Receives standard multiple myeloma medications only
 - If you are randomly assigned, there is an equal chance of being in any of the 3 groups, and you will know which group you are in
- The study medications (investigational or standard) will be given to you during repeating 28-day cycles.
 - The study doctor can talk with you more about these medications, how you will receive them, and when you will receive them
- Qualified participants will receive study medication and study-required medical care at no cost. The study will not pay for other medical care or current medication(s) needed to support your daily healthcare routine.

Can I change my mind?

Yes. You can quit the study at any time, for any reason. Even if you begin the study, you can change your mind at any point.

Myeloma.**

Learn about the **MajesTEC-7**
research study of two investigational
medications for adults with newly diagnosed multiple
myeloma who are either unable to receive a stem
cell transplant or will not receive it as initial therapy.

The MajesTEC-7 Clinical Research Study to Evaluate Two Investigational Medications in Adults with Newly Diagnosed Multiple Myeloma Who Are Either Unable to Receive a Stem Cell Transplant or Are Not Receiving One as Initial Therapy is **Now Enrolling.**

Evaluating Investigational Medication through Clinical Research

What is a clinical research study?

A clinical research study is a carefully designed scientific evaluation of an investigational medication or treatment. Clinical trials are conducted by doctors and researchers.

Why is clinical research important?

Clinical research helps doctors and scientists determine if an investigational medication or therapies are safe and/or effective for use in humans to potentially treat a condition, disease, or disorder. Clinical studies often require large numbers of volunteers to participate in a single study, and sometimes thousands are needed to obtain reliable information.

What is Informed Consent?

“Informed Consent” is a process of information exchange before an adult agrees to participate in research. Potential research participants will be asked to read and sign an informed consent document, but will also be given instructions, verbally and in writing, question/answer sessions and other reading materials to assure the potential study participants’ understanding and willingness to voluntarily enroll in the research.

Before you agree to participate in the study, the study doctor or staff is required to explain all the details of the study, which will include the potential risks and benefits, and address your questions. After all your questions have been answered, and if you wish to enroll in the study, then you will sign a document called the informed consent form to ensure:

- You agree to volunteer.
- You understand the study, including the study procedures, risks, and potential side effects of the investigational medications.
- You understand that you can leave the study at any time, for any reason.

If you don’t understand what is expected of you or what is written in the document, you should continue to ask questions and talk with the study doctor, your family, or others that you trust, until you feel you understand.

Purpose of the MajesTEC-7 study

The purpose of this clinical research study is to determine the safety and efficacy of two investigational medications when each is combined separately with standard medications for multiple myeloma. The two investigational medication combinations will be compared with standard multiple myeloma medications alone. Patients may receive one investigational medication combination or standard medications alone. The investigational medications are being evaluated in adults with newly diagnosed multiple myeloma who are either unable to receive a stem cell transplant or are not receiving one as initial therapy.

Am I eligible?

You may be able to participate in this study if you:

- Are 18 years of age or older
- Have been newly diagnosed with multiple myeloma
- Are not receiving a stem cell transplant as initial therapy

Additional eligibility criteria will be assessed by the study doctor or staff during the screening process prior to enrollment in the study and receiving any study medication. Not all individuals may qualify to participate in this study.
